

PRONICE SILVERBLACK, PROD-ID: 07.1000

Pronice silver black is a blackening/oxidizing agent for silver and produces anthracite-coloured oxide layers on silver surfaces. The colouring is chemically stable and inert. Since Pronice silver black does not contain any free sulphur, there are no undesirable darkening or yellowing effects. The solution only works in direct contact, i.e. there is no contamination of other parts by evaporation. Pronice silver black is compatible with our anti-tarnish systems.

Packing: 1000 ml (ready-to-use)

Advantages

- It produces anthracitic black coloring on silver, silver alloys and copper
- It does not change the brightness of the original metal surface
